Whole Rock Summary	A carbonate with variations in lithology throughout. Appears to have multiple fossils within the sample indicating it's potentially not a distinct fossil coral.		
Thin Section Summary	A very fine grained brownish sediment containing carbonate fossils (foraminifera?). Sample contains distinct clasts of similar, but different sedimentary features. Fossil carbonates come in various spiral, rounded, and elongated shapes. The matrix appears to be a mix of very fine clay and carbonate. Some porespaces contained calcite infill/coating. Some carbonate fossils display a radiating extinction pattern.
