Whole Rock Summary	A conglomerate with large grey zones (phosphorite?) intermixed with tan and green clays. Contains 0.5-1" thick Mn rind and some potential Mn intermixed throughout the sample.		
Thin Section Summary	Zones of Fe-Mn shards intermixed with mottled looking phosphorite and possible clay. Appears to be a few iddingsite shards intermixed in as well although they could represent more Fe rich Fe-Mn grains. A few possible zeolite grains found near some void spaces.
