Whole Rock Summary	A highly vesicular basalt encased within a 5 cm thick FeMn crust. Sample is aphyric(?) and contains only a few regions with filled vesicles (phosphorite). Groundmass is grey with plagioclase microcrysts.		
Thin Section Summary	An aphyric holocrystalline basalt with plagioclase, talc (clinopyroxene?), spinel and clay/iddingsite (olivine). The sample is heavily altered with only some partially recrystallized plagioclase grains and spinel remaining. The sample may have a glass rind with some palagonite alteration but it's difficult to tell if it's glass or FeMn crust. Likely just FeMn layer, followed by a mottled FeMn-phosphorite layer then a thick FeMn layer.
